<u>Aim:</u> Implementing the Searching Algorithms

<u>IDE:</u> Visual Studio Code

Linear Search:-

Theory: -

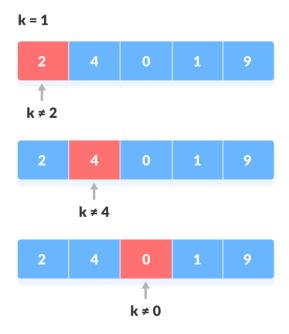

• Linear search is a sequential searching algorithm where we start from one end and check every element of the list until the desired element is found. It is the simplest searching algorithm.

Working of Linear Search:

• The following steps are followed to search for an element k = 1 in the list below.

1) Start from the first element, compare k with each element x.

Faculty of Technology

Department of Information and Communication Technology

Subject: Design and Analysis of Algorithms (01CT0512)

Aim: Implementing the Searching Algorithms

2) If x == k, return the index.

3) Else, return not found.

Algorithm: -

Programming Language: - C++

Code :-

```
#include<iostream>
#include<vector>
using namespace std;

int Linear_Search(vector<int> Array, int key) {
    for (int i = 0; i < Array.size(); i++) {
        if (Array[i] == key) {
            return i;
        }
    }
    return -1;
}</pre>
```

Subject: Design and Analysis of Algorithms (01CT0512)

Aim: Implementing the Searching Algorithms

```
void Print Array(vector<int> Array) {
    for (int i = 0; i < Array.size(); i++) {</pre>
        cout << Array[i] << " ";</pre>
    }
    cout << endl;</pre>
}
void Input Array(vector<int>& Array) {
    for (int i = 0; i < Array.size(); i++) {</pre>
        cout << "Enter Element at index " << i << " : ";</pre>
        cin >> Array[i];
    }
}
int main() {
    int size;
    int key;
    while (true) {
        cout << "Enter The Size of the Array :- " << endl;</pre>
        cin >> size;
        if (size >= 1) {
             break;
        }
        cout << "Invalid Size. Size must be a Positive Integer." << endl;</pre>
    }
    vector<int> Array(size, 0);
    cout << "Enter The Element for the Array:- " << endl;</pre>
    Input Array(Array);
    cout << "Your Input Array Is :- " << endl;</pre>
    Print_Array(Array);
    cout << "Enter the Key to Search In Array :- ";</pre>
    cin >> key;
```

Binary Search

Theory: -

- Binary Search is a searching algorithm for finding an element's position in a sorted array.
- In this approach, the element is always searched in the middle of a portion of an array.
- Binary search can be implemented only on a sorted list of items. If the elements are not sorted already, we need to sort them first.

Working of Bubble Sort

- 1) Binary Search Algorithm can be implemented using Recursion using divide and conquer approach.
- 2) The array in which searching is to be performed is: let x = 4 be the element to be searched.

Subject: Design and Analysis of Algorithms (01CT0512)	Aim: Implementing the Searching Algorithms			
Experiment No: 02	Date: 02-08-2024			

3) Set two pointers low and high at the lowest and the highest positions respectively.

4) Find the middle element mid of the array ie. arr[(low + high)/2] = 6.

- 5) If x == mid, then return mid. Otherwise, compare the elements to be searched for with m.
- 6) If x > mid, compare x with the middle element of the elements on the right side of mid. This is done by setting low to low = mid + 1.
- 7) Else, compare x with the middle element of the elements on the left side of mid. This is done by setting high to high = mid 1.

8) Repeat steps 4 to 7 until low meets high.

9) x = 4 is found.
